Data security awareness

v2.6

How your meeting data can leak through Read AI

When Read AI is added to a Zoom meeting, the meeting is recorded, transcribed and summarized, and that data can reach people you never intended.

Where data can leak

1 Reports sent to all participants

The summary, full transcript and recording may reach everyone who attended.

2 External participants

Internal discussions can end up with people outside the university.

3 Editor access for whoever adds Read

They can share the report with anyone, regardless of your settings.

4 Auto-join through your calendar

It may join confidential or sensitive meetings without you noticing.

5 Stored by a third party

Recordings and transcripts are processed and kept by a provider outside the university.

6 Distribution through other apps

Reports can be pushed automatically to Slack, Teams or mailing lists.

What could leak?

Student records | Personal information | Management decisions | Financial data | Contracts & tenders

Book a Coffee with IT session — just 10 minutes

Learn how to protect your meeting data when using Read AI.

In person at IT | Remote via Zoom
